

W1 dose-response: PSNR gain of the learnable camera model vs pre-training angular camera error
24 paired scenes, 3 camera families, one shared masked eval pass ($r = 0.95$ on fisheye, full frame on pinhole)

A. PRE-REGISTERED axis: E_{sfm} (training-free)

FALSIFIED (prereg cond. 1): $\rho = -0.45$ ($p = 0.029$) across tracks, the sign is NEGATIVE. WITHIN track (exploratory): $\rho = +0.20$ ($p = 0.416$) — opposite sign.

B. E_{learned} — SHAPE ONLY, NOT A PREDICTOR

CIRCULAR: E_{learned} is the optimiser's own output (plan §2.3). $\rho = +0.62$ ($p = 0.0012$).
